

Take charge of your business with PULSE Dashboard Reporting Software

Designer Module

PULSE DASHBOARD is revolutionary software that lets you leverage your Macola® investment in a new way —with real-time display of vital business metrics, and detailed analysis with the click of a mouse. You will be able to track critical factors for your business, on-screen and real-time. Other PULSE modules include Financial, Customer Service, Sales and Marketing, Inventory, Purchasing, Production and Material Requirements.

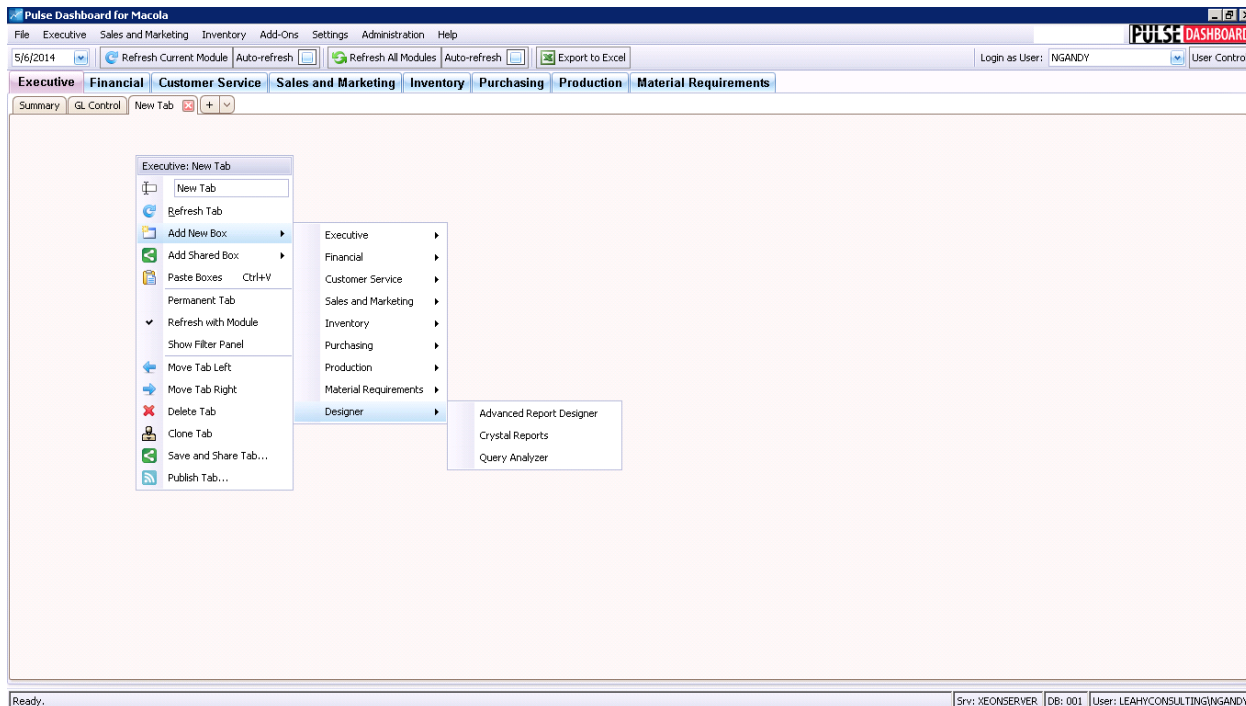

PULSE Dashboard adds value to your Macola® investment

- Manage with real-time data, on-screen, company-wide, all the time
- Inconsistencies between reports from different departments are eliminated
- Important metrics not found in standard Macola® software
- One-click drill-down to view details & One-click report writer generates custom reports
- Export all data to Excel/printer/PDF/e-mail
- Installation & training in an afternoon

The PULSE Designer Module offers:

The User may further enhance reporting capabilities based on data from the Macola database and other SQL databases by allowing the User to add three additional types of reports not available in other modules of Dashboard. These reports may be added to any tab in any Module of PULSE Dashboard.

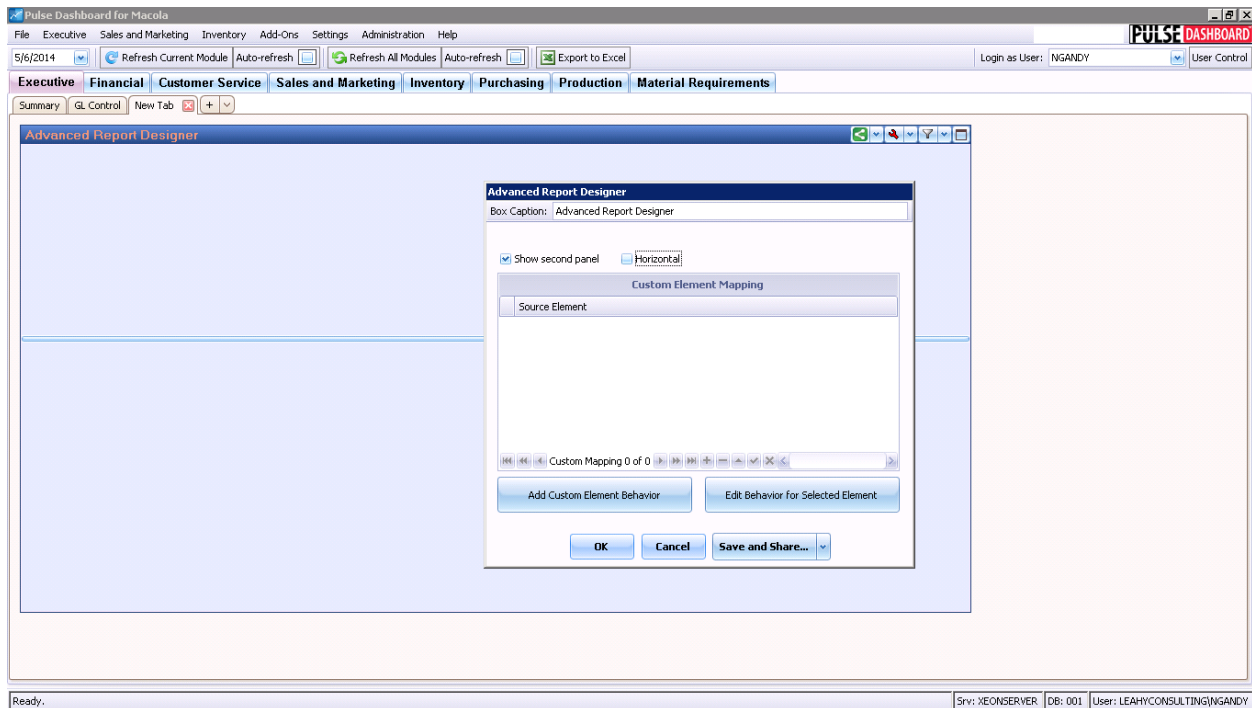

The reports available in the Designer Module include the Advanced Report Designer, the Crystal Report box, and the Query Analyzer Report.

Advanced Report Designer

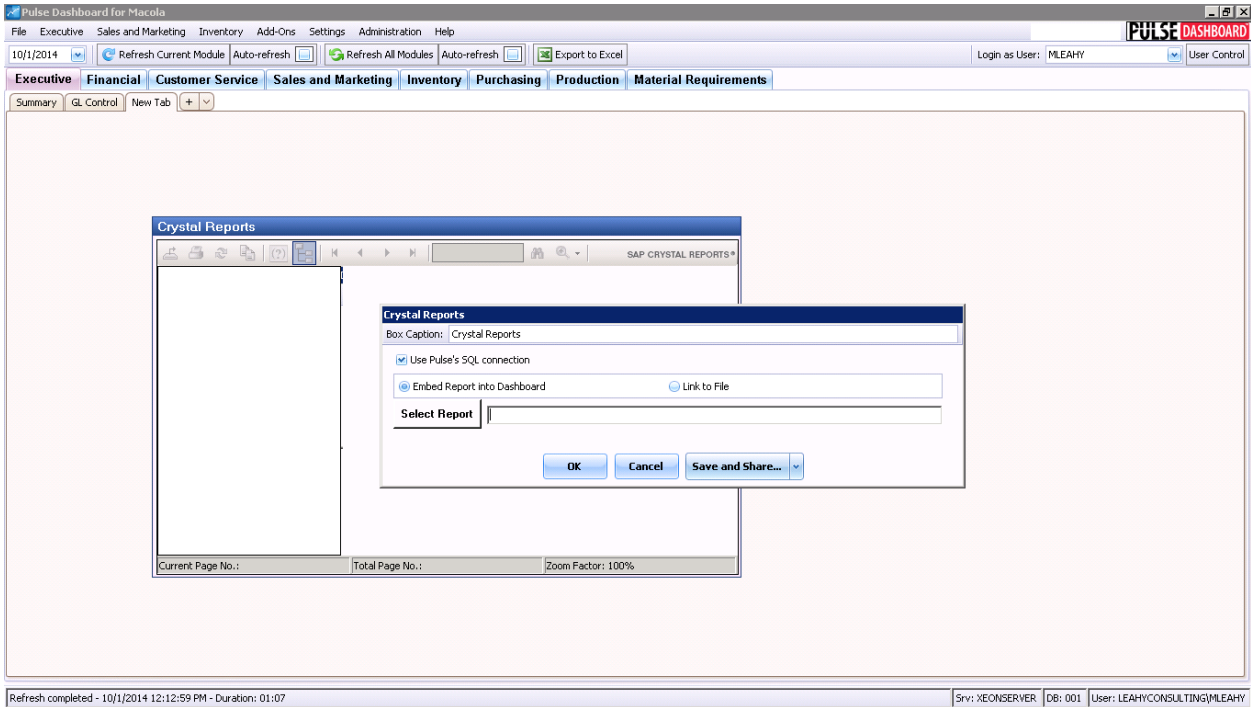

The Advanced Designer Report allows the User to “tie” two existing reports together that contain related but different information into a single report.

As an example, the User may require AR Aging information for a customer to be displayed on a report and also detailed information about Sales Orders for that same customer. Using standard reports in Pulse Dashboard this may be achieved on two separate reports. By adding the two separate reports to an Advanced Designer Report, the information on the two individual reports is automatically associated by a Customer Number. When viewing information about a Customer in one report the details are reflected on the associated report. By scrolling to a different Customer, the details change to those of the highlighted Customer. This is similar to the way that Drilldown screens function in standard Pulse Dashboard reports.

Crystal Reports

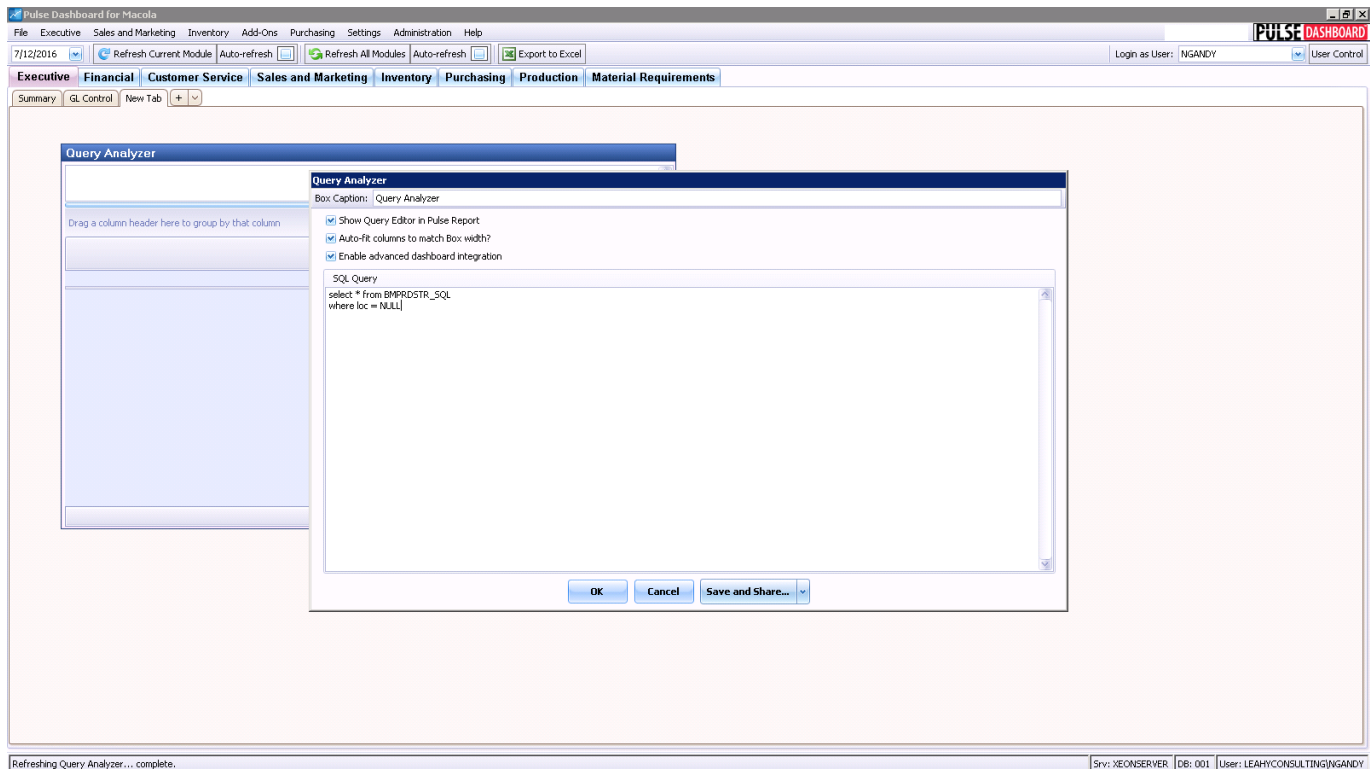

The Crystal Reports box allows the User to access and run an existing Crystal Report from inside of Pulse Dashboard. This simplifies the process of running custom reports by reducing the number of icons on the Desktop for those reports. The reports may now be in one reliable location using the same connection information as Pulse Dashboard. Moving a Crystal report no longer disconnects the report from the database.

Query Analyzer

The Query Analyzer Report allows the user to create a truly customized report from any information within the Macola database as well as any information available in ANY SQL database.

Using SQL scripting language or by calling a Stored Procedure or SQL View, the User may create a report that looks the same as any standard Pulse Dashboard Report. The information contained in the custom report may be sorted, filtered, printed or exported to Excel just as you would any standard report in Pulse Dashboard. While the familiar Column Chooser icon is not available on this report there can be a similar list of columns to choose from can be added to the report by including the additional columns to the script. These additional columns are available to be added to the report if needed.
